ABSTRACT

"Wildlife and Me" is a part of a series of materials in the Wildlife Education Service for Kansas youth series. The goal of the program is to provide information about wildlife and to establish in children an awareness and appreciation of wildlife. A booklet for children and a teacher's guide are included. The booklet was written for first-grade children but can be easily adapted for other grades. The materials are designed for multidisciplinary use. The teacher's guide includes the following materials: (1) an introduction and foreword; (2) an opinionnaire about the materials; (3) a student award form; (4) ideas for classroom bulletin boards; (5) reproducible worksheets for students; (6) supplemental activities and approaches for language arts, science, art, industrial arts, mathematics, social studies, music, and physical education; and (7) appendices which list resources and references, and includes a glossary of terms used in teaching this topic. (CW)

* Reproductions supplied by EDRS are the best that can be made *

Introduction

WILDLIFE AND ME is part of a series of materials in the Wildlife Education Service for Kansas youth from the Kansas Department of Wildlife and Parks. (See inside cover of the student booklet for other titles.) The material is designed for use by teachers. The goal of the program is to provide information about wildlife and to establish in children an awareness and appreciation of wildlife. This booklet was written for first grade but can be easily adapted for other grades. The study of wildlife need not be limited to science class but should be multidisciplinary. Enrich your existing curricula with this material.

You do not have to be a biologist or wildlife expert to teach about wildlife. The Wildlife Education Service materials were written for anyone who has an interest in teaching children about wildlife and the environment. The worksheets and activities in the teacher's guide reinforce information in the student's booklet. Do any quantity or combination of activities and worksheets that are appropriate for your schedule. The lessons may be used as a unit of study or used throughout the year when time allows. The worksheets may be done in whatever sequence you choose.

ONE set of each grade's materials will be provided to each school to be shared among the teachers. The booklet may be reproduced if additional copies are needed or you choose to have copies for students to take home.

The Department of Wildlife and Parks has a Wildlife Reference Center located at the Pratt headquarters. The center includes films, filmstrips, slide series, games, posters, books, and other wildlife related material available to schools on a free loan basis. Return mail cost is the only expense to the school for use of this material. Refer to your Wildlife Reference Center catalog for materials appropriate to your study. Especially recommended for use with this booklet are: FS-23, Wildlife Animal Families; FS-18, Plants and Animals in the City; 3-6, A Child's Book of Birds; 14-1, Sharing Nature With Children; 14-2, The Reasons for Seasons. Be sure to check your Wildlife Reference Center catalog for other materials. A catalog has been sent to each school district office. Please contact your administration office for your district's copy. Orders will be filled on a first-come, first-served basis, so we suggest sending your requests in early.

To be effective, material must be used. This format was written to be easy to use, ready to use, and flexible. Little additional preparation or equipment is required. The most important ingredients for success in your lessons will be your enthusiasm and imagination. Technical references can be obtained from the Wildlife Reference Center or your local library.

The material is appropriate throughout Kansas, no matter what size community or region of the state you live in. It is not necessary to have a natural area near your school; use whatever is available. Many of the supplementary activities can be done on the schoolgrounds or in the classroom.

This program was funded from hunting and fishing license fees and partially by the Nongame Wildlife Tax Check-off Program.

Remind your students that when they are outside they are company in the homes of wildlife; therefore, their best manners should be used.

Foreword

Dear Teachers,

Kansas has a diversity of climate, terrain, and vegetation that provides for a variety of wildlife. Use these attributes to the fullest in your classroom. Tap your students interest in wildlife in all curricula areas by exploring what Kansas wildlife has to offer. People, especially children, need to be more aware of wildlife and how their actions affect wildlife. The future of wildlife depends on actions we make today. Educate our young people to care about their future and the future of wildlife.

You can do me a favor by contacting the K-6 teachers in your district and letting them know, or reminding them of, what the Wildlife Education Service has to offer. I've sent out curriculum, Wildlife Reference Center catalogs, and numerous other resource materials to every public and private building in the state. I've tried every avenue within budgetary limits, that I can think of to inform teachers, librarians, and administrators of the Wildlife Education Service. A reminder from you may get them involved.

Let me know how I can help you better inform you district's teachers. If the K-6 curriculum and other materials that have been sent are lost or misplaced, contact me for a limited number of replacement sets. Thank you for your help.

Please direct any questions or comments concerning the Wildlife Education Service materials to me at the Pratt headquarters. Good luck for a successful and exciting learning experience.

Sincerely,

Joyce Harmon Depenbusch

WILDLIFE'S RAINBOW

Directions: Color each page and find out more about the many colors of wildlife.

NAME _____

Red is the color of lady bugs, cardinals, and apples to munch on a warm, fall day. Red sunsets glow on red foxes, red-headed woodpeckers, and Indian blanket flowers in the prairie.

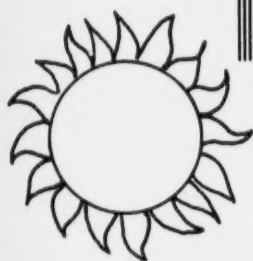

WILDLIFE'S RAINBOW

Green is the color of grasshoppers and frogs that green herons eat. Leaf hoppers, green snakes, and katydids live near the green leaves and grass.

WILDLIFE'S RAINBOW

NAME _____

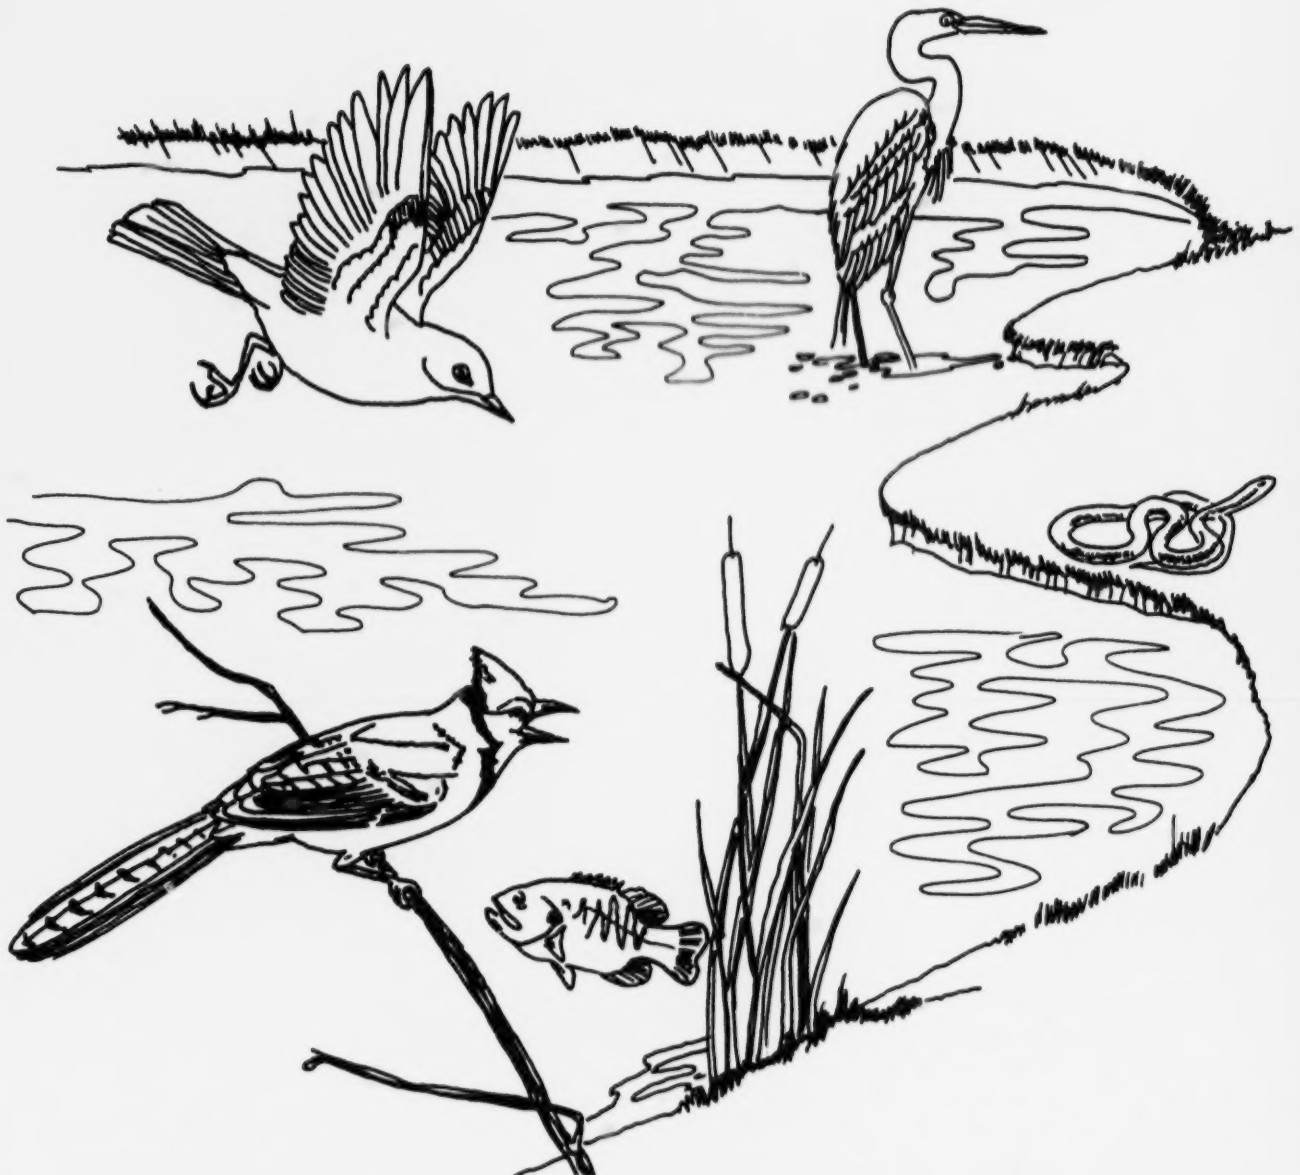

Yellow is the color of bumblebees, dandelions, meadow-larks, and dried buffalo grass in the morning light. The sun shines on the sunflowers, wheat, and sunfish we have in Kansas.

wildlife
education
service

WILDLIFE'S RAINBOW

Blue is the color of bluejays and bluebirds flying in the sky. A blue racer plays near the water where the bluegills and great blue herons live.

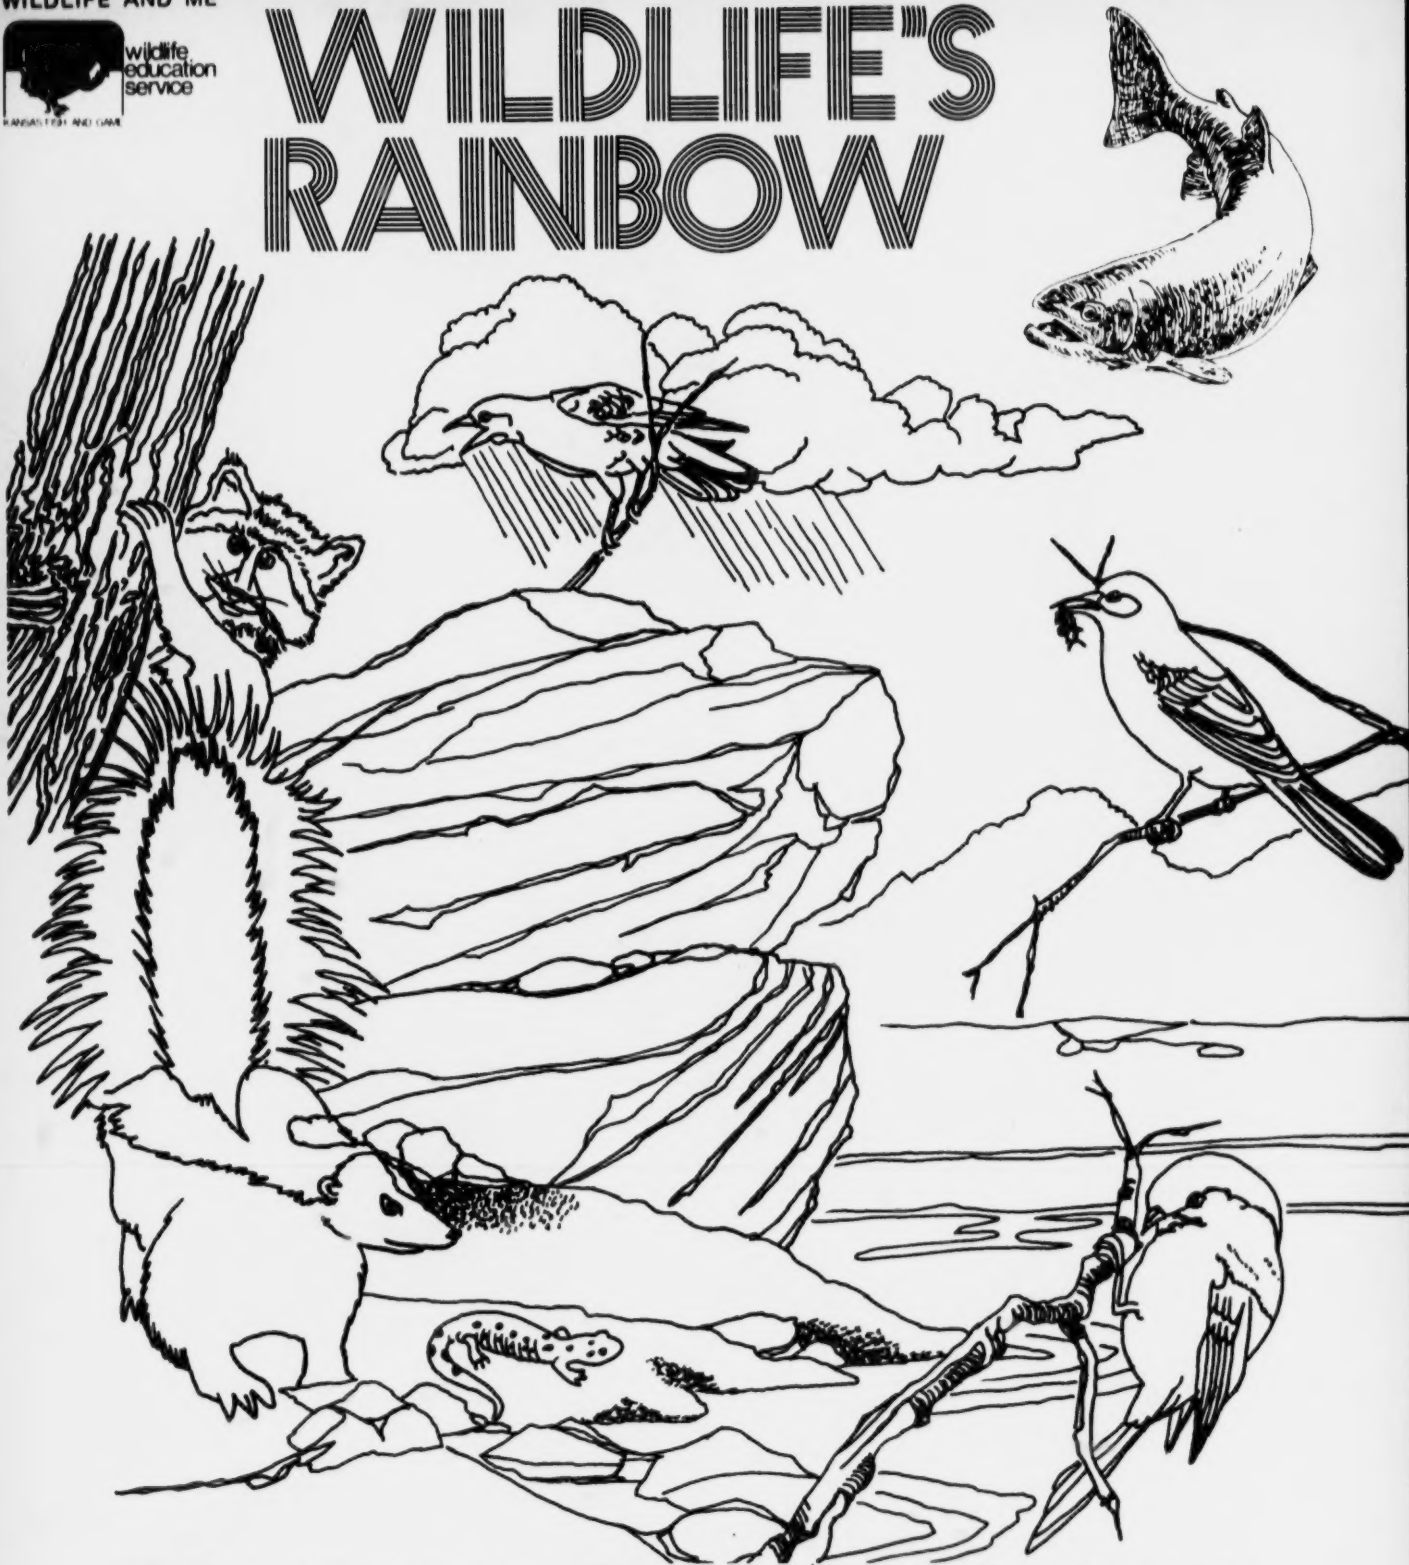

WILDLIFE'S RAINBOW

Brown is the color of buffaloes, owls; and rattlesnakes that live in the prairie. Squirrels, rabbits, and deer jump over branches in the woods.

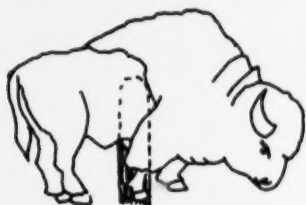

WILDLIFE'S RAINBOW

Black is the color of a skunk's bushy fur, silly salamanders in the mud, and a caterpillar in the blackbird's beak. Dark, stormy clouds rain on chickadees, crows, and the raccoon's black mask.

WILDLIFE PUPPETS

Add to the fun of your wildlife study by making puppets of Kansas wildlife. STICK PUPPETS are easy to make by taping or gluing a straight stick onto a drawing or painting of an animal. Students can make their own and create a story to display their designs.

Make a MOUTH or HAND PUPPET out of an old sock or fabric scraps. Add yarn, felt, buttons, etc. to detail the creature. The pattern below can be used as a basic design for any animal. Alter this pattern for your particular animal choice. (1/8-inch seam allowances have been included.)

Assemble the head, body, and arm with hand sewing or machine stitching. Finish the mouth by gluing the cardboard piece into place on the head, and the felt mouthpiece onto the cardboard to complete the mouth.

Organize a puppet show for another class or the entire school.

Wildlife Paper Cutouts

Include wildlife in your art projects by making wildlife paper cutouts. Use the patterns below or ideas your students come up with. They can be hung from the ceiling with string or decorate halls and windows.

Directions: Fold a square piece of paper in half twice. Draw your animal design, making sure the edges that are supposed to connect are on a fold (see example). Cut out your pattern and add details with crayons or colored markers.

Instead of a squirrel, try a prairie dog, rabbit, antelope, fish, buffalo, raccoon, deer, etc. The list is endless and kids of all ages can join in the fun.

Supplementary Activities and Approaches

Listed below are approaches for using the student booklet and worksheets. Additional activities have been included for those teachers who are interested in furthering their study of wildlife. These activities can be done in a variety of curricula areas and are listed by subject. Basic skills will be practiced while students learn more about wildlife. Many of these ideas may already be familiar; others are new. A few of the activities were adapted from *Multidisciplinary Wildlife Teaching Activities*, by William Hernbrode, and *Sharing Nature With Children*, by Joseph Cornell. Check the Wildlife Reference Center for further activity sources. There are several excellent activity guides listed under Miscellaneous Books.

Language Arts

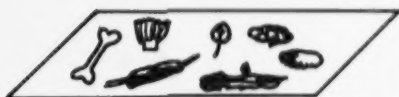

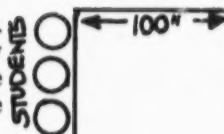

- The story script may be taped so that students may listen while they read.
- After reading the story, have your students make up their own stories or poems about the animals they have seen in the booklet. Students can act out their stories or draw pictures to express their ideas. Have the children think about what it would be like to live in a world without wildlife.
- The words in the script, and especially those listed on the vocabulary page, can be used on a spelling list. If you have an existing list, these could be added as bonus words.
- Use the booklet as a supplementary reading text to study compound words, blends, vowels, syllabication, affixes, parts of speech, etc.
- Sequencing skills can be practiced if students draw pictures of wildlife in a comic strip format. Cut the pictures apart, exchange with a friend, and see if that person can reassemble the story in the correct sequence.
- How many words can students find that rhyme with the words in the vocabulary list?
- Write plays or skits about wildlife and its habitat. Research the animals so that the role plays are true to life.
- For more printing practice, have students write the wildlife alphabet animal names from the worksheet pages on separate sheets of paper. Students can add other wildlife to the alphabet. Suggest that they use examples of animals found in Kansas.
- Have students list natural things that begin or end with each letter of the alphabet.
- If you read daily to your class, why not include stories or poems about animals and the environment, especially those related to Kansas? Recommend your favorite selections to the school or public library for their future purchases.
- Look at the vocabulary list at the end of the booklet and write the words so the class can see them. Assign each child a letter that is found in one of the words. More than one child can be a particular letter. The children are instructed to find other people who, when combined, will form a word from the list.

Science

—Take a 100-inch hike by measuring off an area approximately 100 inches long. Have students spread out along a line that is perpendicular to the first line. They move on hands and knees to count all the small animals that they find in the 100-inches. Use magnifying lenses, if available. Compare and discuss within the group.

—Have a "touch and see" table in your classroom with tree bark, rocks, bones, shells, etc. that your students can explore in their free time. Add items that the children bring in. If you don't have room for a table, have a "touch and feel" box of appropriate size. Cut opening for hand and arm and place objects inside that students may identify by touch only.

—Mark off a 40-to-50 foot trail and place 10 to 15 man-made objects along it. The children walk silently along the trail trying to spot (but not pick up) as many of the objects as they can. When they reach the end of the trail, they whisper the number of objects they saw to you. If they missed any, see if they can find them on a second try. End with a discussion of camouflage, and natural and man-made things. What examples of camouflage did they find?

—Build a class terrarium so that children can observe animals such as snails, earthworms, beetles, etc. Children can observe the interaction of animals and plants. How are plants and animals alike, and how do they differ?

—Each child builds a nature trail for an ant or other small animal. They find five to ten interesting features in their area and mark them with twigs or popsicle sticks. These are the points of interest, or stations, on the trail as seen from the perspective of the small animal. Imaginations should be used to lead other students as spectators on the trail. An area of grass might be a jungle. A rock could be a cliff or mountain. Spectators follow the trail on hands and knees to observe the small aspects of the environment. Everyone should go on at least one tour of another child's trail. Discuss the word "micro" and the importance of small living things.

—Start an ant colony in a narrow glass case. Students can easily see the underground world of the ants. What do they eat? How do they communicate? How do they use their antennae?

—In your schoolyard, set up a platform about four feet off the ground. Place on it pieces of string, yarn, cloth, small sticks, and other items that birds might use to build a nest. Keep records of what items are taken. Do the birds seem to choose one item over another? Can anyone spot the colored yarn and string in nearby nests?

—Take a census of natural and man-made things in your school yard. Divide the natural list into plants and animals. Take another census of living and non-living things.

—Children become more aware of their senses through outdoor activities. Have the children count the number of things they can see or smell from where they are standing. How many different things can they feel from where they sit? (Such as soil, the wind, tree bark, leaves) Next, have them close their eyes, listen carefully, and hold up a finger for each different sound they hear.

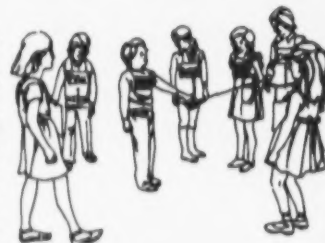

—Discuss the need for clean air and water in order for wildlife and people to survive. Children may be able to relate these basic needs to their family pet.

—To better understand the insect world, observe a variety of insects in your school yard. Attract them with strips of fabric soaked in sugar water or molasses. Notice the different sizes, shapes, and adaptations. Compare insects from as many habitats as possible.

—Take your students on a hike around the school grounds, neighborhood, or nearby parks. Encourage them to use their imaginations during the exploration. The woody areas may become jungles, and buildings mountains. Where are the wild animals? Are there different animals in the shrubs than on the school lawn? Help your students be aware that they are looking for very small animals which are still an important part of nature. Stress to your class that the area should be kept clean and treated with care so that others may enjoy it. Back in the classroom, students can write stories or draw pictures of their adventures.

—Play a modified version of the food web game. (See *Food for Wildlife Teacher's Guide* for a more complicated version of the game.) Have students draw on 3" x 5" or 5" x 7" cards (or have available for them) pictures of the following: the sun, water, air, soil, a plant, and the animal of their choice (total of 6 cards). Place the cards on a piece of paper and have students draw lines to those cards that need each other. If the students started out with their animal being an herbivore (plant-eater), have them add a carnivore (meat-eater) or omnivore (eats both plants and animals), and vice versa.

—Students may have grouped or classified objects. Let them classify the animals in the booklet by size. Take them outside to try the same activity on animals in the schoolyard. They could also be grouped by color, abundance, living or non-living, or habitat preference (i.e. woods, lawn, bushes).

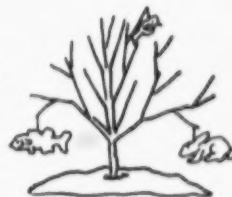

—Take a closeup look under water with a waterscope made from a milk carton. Cut off the top end of the carton and cut a window in the bottom. Cover this with clear cellophane. Students place their waterscope in a pond or stream to observe what is in the water.

Art

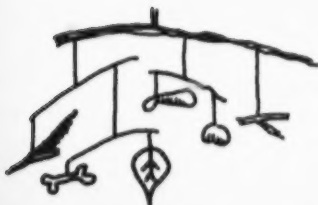

—Use the Wildlife's Rainbow pages to study colors. Explain that most animals are not just one color but a variety. Give each student a square of construction paper, making sure that there are a variety of colors. Have the children find one or more things in the environment that are close to that color.

—Make copies of the student booklet pages for students to color and take home. How many of the animals are brown, gray, green, etc.?

—Make an "animal tree" from a dried branch that has many places to hang ornaments. Have the children draw, paint, or build the animals of their choice. If necessary, fasten heavier paper to the back of each picture for support. Attach the decorations to the tree. The pictures can be changed throughout the year with animal homes and foods added.

—Design wildlife bookmarks or book jackets. Cover surface with clear contact paper for durability.

—Construct nature mobiles. Gather sticks or branches to support the mobile and attach natural or un-natural objects with string or yarn. These objects can be collected while on a hike, but care should be taken that damage is not done to the environment. Students can hang their mobiles in the classroom or take them home to share.

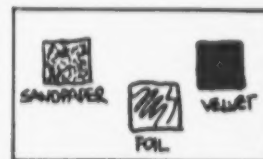

—Make wildlife puppets from the enclosed patterns. Perform short puppet plays for other classes.

—Explore the outdoors by making texture rubbings. Section paper by folding it several times. Use a crayon to rub a variety of materials on each section. Children may label each section and compare with a friend. You may suggest items such as 5 different leaves, 4 kinds of tree bark, or the bottoms of their shoes.

—Take students outside to observe their environment. Study textures by giving each child a 5 x 7 index card with a small square of sandpaper, aluminum foil, and velvet glued on it. Children compare textures they feel outside with ones on their cards. Which is softest? Which is roughest? Try the activity another time but use additional textures.

—Make jigsaw puzzles from the children's animal drawings or from copies of the booklet drawings.

—While hiking through different habitats, collect natural objects such as seeds, pine cones, dead twigs, dried mushrooms, etc. to make a nature picture or class collage. Items can be glued to cardboard and may be separated by habitat to form a three-dimensional habitat artifact collection.

—Build animal models from rocks or potatoes. Add pipe cleaners, construction paper, buttons, or natural objects, such as seeds and leaves to complete the creatures.

—Make wildlife sculptures from tumbleweeds, sand, or snow. Paint the finished sculpture with dilute tempera in a spray bottle or with spray paint. Details can be added with a paint brush or additional materials such as fabrics.

Industrial Arts

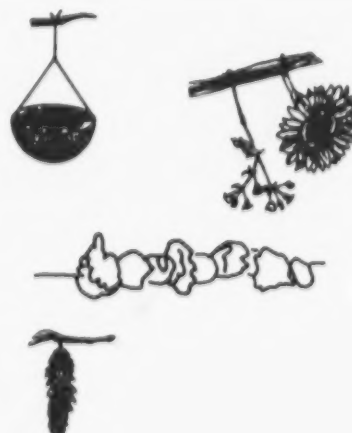

You can attract wildlife to your home and school yard if you provide habitat. Here are some easy-to-construct feeders that will bring enjoyment during the winter.

—Make bird feeders from dried grapefruit rinds or coconut shell halves. Hang them from a branch with string. Fill with seed.

—Hang sunflower heads or thistles from branches. Set aside a plot at home or in the schoolyard to grow them.

—String popcorn, peanuts and cranberries and drape around a tree.

—Press peanut butter into a pine cone and roll the cone in a mixture of bird seed. Hang with string from a tree branch.

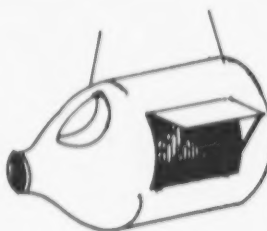

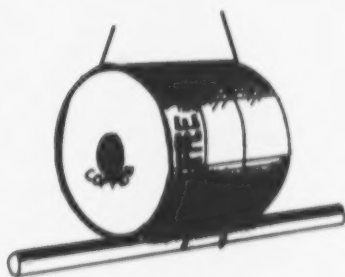

—Make a feeder for small birds with a coffee can, wire, and a dowel or branch. Cut out the bottom of the can. Carefully cut out two 2-inch holes in the center of two plastic lids. Put the lids on the can. Hang the feeder horizontally by running wire through small holes in the lids and through the can. Attach a stick or dowel as a perch.

—Recycle detergent and bleach bottles to make feeders. Thoroughly clean the containers. Hang the detergent bottles vertically after cutting two circles the size of a 50-cent piece in their middles on each side. Slide a perch through nail holes below the opening. To make a horizontal feeder from a bleach bottle, cut 6-inch long and 4-inch wide flaps in the side of the bottle. Prop these open with a twig. Attach a dowel or twig perch and hang with wire.

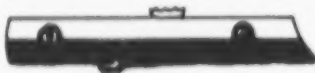

—Use a half-gallon milk carton for a feeder. Cut out an opening for feed about 1¼ inches deep. Hold up the roof with a straightened paper clip inserted in the side of the carton and the roof. Bend the clip to hold the roof in place. Reseal the carton with a stapler and hang with a wire, or set feeder on a windowsill. Small holes can be made in the bottom of the feeder to let rainwater out.

—Suet feeders are easy to make from an old onion bag or nylon net. Open the bag and fill it with suet (animal fat) from the grocery or meat market. Tie the bag shut and hang from a tree branch.

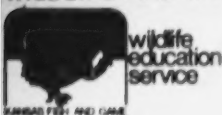

—Build a log feeder from a dead branch about 15 inches long and 3 inches thick. Nail bottle caps onto it. Attach an eye bolt into the top of the log to hang the feeder vertically. Fill the caps with a peanut butter-bird seed mixture. An alternate method is to drill holes in the log and fill them with a mixture of bird seed, peanut butter, and ground suet.

—Two aluminum pie pans can be combined with one 8- to 10-inch dowel and two jar lids to make a feeder. Place a metal jar lid in the center of a large aluminum pan and another inside a smaller pan. These lids will add weight and support to the feeder. Nail one end of the dowel to the small pan and lid arrangement. Attach the top of the feeder (large pan and lid) to the other end of the dowel with a nail or eye bolt.

It is very important to continue feeding birds once you begin in the winter. The birds will learn to depend on you for food until they can find other sources of food in the spring. If you stop feeding during the cold weather, the birds may suffer.

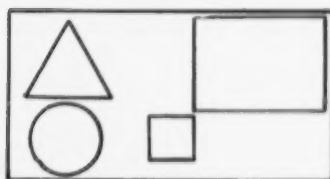

Keep a record of the birds you see and their behavior. What are the different birds' favorite foods? Have the class bring in leftover bread crusts, oatmeal, corn, unsugared cereals, etc. to fill the feeders. Most meat markets will give suet away or sell it inexpensively. Ground suet is a good addition to the seed mixtures. The fat will help the birds withstand the winter cold.

Mathematics

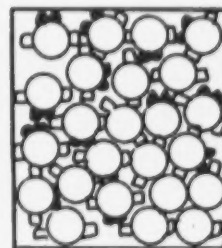

—As a review of the booklet and use of students' observational skills, ask your students to find: four animals with four legs, three animals that can fly, two animals that have feathers, three that have fur, four that can swim (fly, walk). How many animals can they find that have a beak? What animals have they ever seen in the wild?

—Cut out animal pictures from magazines or photocopies from the children's booklet. Arrange the pictures on sheets, such as 1 buffalo, 2 lizards, 3 rabbits, etc.

—The natural environment is made up of different shapes. Begin a study of geometry by giving the children cards with a circle, square, triangle and rectangle drawn on them. Have them find things on the school grounds that are similar to those shapes.

—Demonstrate the effects of lack of space and crowding with the following activity: Place an old blanket, sheet, or tarp outside or on the floor. Measure the area of the blanket. Ask the entire class to stand somewhere on the blanket. The children then get off and you fold the blanket in half. Measure the new area and have the children get back on the blanket. They may need to work at getting in the space. Have them get off and, once again, fold the blanket in half. Measure the new area. Students should attempt to fit on this blanket. They should use their imaginations to get most of the children on. Continue the procedure until only one person fits. Have the children compare this situation with that of wildlife and habitat loss. Wildlife and people need space.

—While on a hike, find animal tracks in the mud or snow. Measure the distance between tracks of an animal. Is the distance longer or shorter if the animal is running? What direction is the animal coming from? Compare with human tracks.

Social Studies

—Learn more about the seasons by keeping a record of changes throughout the year. Have the class pick a special spot on the schoolgrounds, or allow each child his or her own location. Observe the changes that take place through the year. How do shadows change with the time of day and season?

—Have your students list all things that they need to live. How does this list compare with that of wildlife? Which items overlap as needs of humans and wildlife? Can the children revise their list and do without some things? Stress food, water, and cover as the essentials for wildlife and humans. Try to differentiate between what we need to survive and which items are for a "better" standard of living.

—Students list the habitats they live in, such as home, school, etc. What is their favorite habitat? Their least favorite? Which habitat do they spend the most time in?

—Ask the children to observe and list the changes people have made to habitat. Discuss their lists and ask how they think each of the changes has affected wildlife. If they had control over the past, how would they have acted differently? If they could control the future, how would they plan to manage for people and wildlife to share the world.

—People use natural resources at a fast rate. Recommend to your students that they recycle and conserve natural resources as much as possible. Organize a paper or aluminum recycling project for your school or district.

Music

—There are many songs dealing with the environment or specific animals, such as "The Ants Go Marching." Find some other songs that deal with wildlife, or put a poem to music.

—Make a cassette tape of animal sounds. Bird songs are available through the Wildlife Reference Center. Have children listen to calls or songs of common birds. Tap out the rhythm of the animal sounds on your desk top or by clapping your hands.

—Have children listen to bird or other animal sounds. Then have them design an animal they think would make that sound. Later, identify the animal and compare the real animal with the imaginary.

—Write new wildlife-related lyrics to old songs.

—Some birds, such as the mockingbird, can imitate other birds. How well can you "mock" bird songs? Put words to the beat of bird songs and calls.

—Which animals would make good sopranos, altos, tenors, or basses? Listen to tapes, records, or the animals themselves while on a walk.

—Some animals makes specific calls, warning signals, or songs. Design instruments that sound like animals. Use wood, sandpaper, glue, construction paper, and odds and ends to create the sounds.

Physical Education

—Review what you've learned about wildlife and get some exercise by playing "Prairie Chickens and Coyotes." Divide the class into two equal teams. One group is The Prairie Chickens; the other is The Coyotes. The teams line up facing each other about 3 feet apart. Home territory is marked with a line 15 feet behind each team. The group leader or teacher makes a statement such as, "Wildlife needs water, food and cover to live." If the statement is true, the Coyotes chase the Prairie Chickens, trying to catch them before they reach their home territory. If the statement is false, the Prairie Chickens chase the Coyotes. Any players who are caught become members of the other team. Some questions might cause confusion. The leader should stay quiet until after the commotion has ended and then discuss the answer with the group. Sample questions might include: "Wildlife means all wild, living animals." (T) "Wildlife needs jellybeans to live." (F)

Home

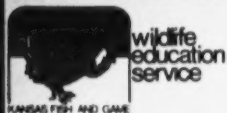

Home

—When students are playing or running on the playground, have them pick up litter. Their ticket to get back inside is three pieces of litter.

—Play porcupine tag. The porcupine is "it" and can move easily while the other players are required to hold one leg and hop. They can be tagged by the porcupine if they let go of their leg. If caught, they become the porcupine.

—Divide class into groups of approximately 5. Give each group an animal name. The group combines to form the animal. The rest of the class tries to guess what it is.

—Play “Prairie Rattlers.” The group forms a circle around two blindfolded members, making a “snake pit.” The blindfolded players are the prairie rattlers. Their rattles are tin cans with stones in them. One snake is the pursuer, who has 5 shakes of the rattle to find and touch the pursued. The pursued must respond immediately after each shake from the pursuer. The pursued can shake as often as he/she dares. The players forming the snake pit keep track of the rattles and cheer. The snake pit may change in size and shape to add variety.

—Take a “blind trust” walk. Students work with partners, each having a chance to be blindfolded. While “blind,” they are carefully led to explore surrounding areas using their other senses. The leader may have the blindfolded person experience touching a feather or tree bark, smelling the soil, listening to the wind, etc. A group can be led together by having participants hang onto a rope throughout the course. Conclude the activity by seeing if the participants can retrace their steps when the blindfolds are removed.

—Divide the class into small groups for a game of leap frog. Discuss how frogs move. Expand the game to include other animals. Have students act out the movements of other wildlife and let the other students guess what they are pretending to be.

—Take a “blindfolded caterpillar crawl” outdoors. Children can become segmented snakes by joining together.

—Divide class into groups of approximately 5. Give each group an animal name. The group combines to form the animal. The rest of the class tries to guess what it is.

—Students can express animal behavior and movement by playing a passenger on Noah’s Ark. Count the number of children present. Write a list of animals that is half the number of the children. Write each animal twice so that the players will have partners (“two by two”). If there is an odd number, have one group of three. Distribute the animal names at random in “closed ballot” form. The children now become the animal and act like it. They find their partner by observing the movements, sounds, and shapes of the other animals. No talking is allowed. When partners have found each other, they stand together quietly.

—Play “Nesting Red-Winged Blackbirds.” Players are in groups of 3, except for one person who is the caller. Two of the group hold hands and form a cattail nest. The third player is a red-winged blackbird who stands inside the nest. When the caller says, “Blackbirds find a new nest,” the birds change locations and the caller tries to find a home. The un-nested bird becomes the new caller. After awhile, let the nests and bird players change roles.

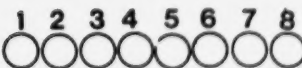

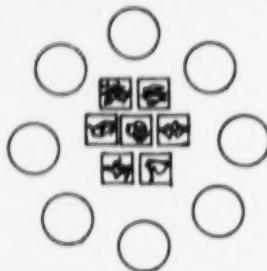

—Play “Fox and Field Mice.” Ten children become foxes; the rest field mice. They stand in the boundaries as shown in the diagram. Foxes may run from side to side but not out of their boundary line. The field mice line up at the starting line and try to make it to the finish line without being tagged by a fox. As many as four mice run at one time. Field mice are safe at home or while standing on any line. They can walk back and forth on the lines waiting to escape. If caught, mice sit in the den. Start a new game when several mice have made it safely home or when several are captured in the den. Have the mice and foxes reverse roles.

—Review the animals in the booklet while exercising. Make several copies of 5 to 7 animal pictures. Tape these on tag board and fasten them to the floor. Students form a circle around the pictures and hop, skip, walk, or run in the circle. When the instructor says “Stop” or claps his or her hands, everyone stops moving. The teacher calls out the name of one of the animals and the children try to find the animal and stand by the picture (one person per picture). The children who did not find a picture return to the circle and resume moving until another animal's name is called. The game is finished when all of the children are by a picture.

—The class forms two teams and counts off. The teams face each other with pictures of animals on a center line. The instructor says the name of one of the animals, then calls a number. The two children with that number run to the correct pictures, try to get it, and return to their places in line. The picture is replaced and play continues. The instructor keeps score. Add a challenge by having the player who does not reach the picture first attempt to tag the other player before he or she returns to home base. If the player is not tagged, the team gains two points; if tagged, one point.

—Play “Catfish and Bluegill” by choosing one person as the catfish. The others are bluegills. The bluegills form a circle around the catfish. The bluegills have home base lines on either side of the circle. When instructed, the bluegills skip or hop around the circle. The catfish may jump out at any time and tag a bluegill. Any bluegills that are tagged before they reach home become catfish. Play continues until all of the bluegills are gone.

Glossary

Many of the terms below have been defined in the curriculum material. Check an ecology or biology book for further definitions and information. Definitions are taken from context of use in texts and the following sources:

Multidisciplinary Wildlife Teaching Activities, by William R. Hernbrode; *Project Learning Tree*, by the American Forest Institute, Inc.; and *The Random House Dictionary of the English Language, College Edition*.

ACRE—A unit of land equal to 43,560 square feet or 1/640 square mile.

ADAPT—To make suitable to environmental conditions; adjust.

AMPHIBIAN—Cold-blooded vertebrates that are covered with moist skin and live partially in an aquatic habitat and partially on dry land. This group includes frogs, toads, and salamanders.

ANNUAL TURNOVER—The rate of replacement of individual animals in a population. Bobwhite quail may have a 70 percent annual turnover. Only 30 percent of the birds alive at the beginning of the year are alive at the end of the year.

ANTLER—Bone-like growth on members of the deer family that falls off and grows back each year. Horns differ from antlers because they do not fall off each year. A few horned animals drop the outside sheath of the horn (such as antelope).

AQUATIC—Living or growing in water.

ARACHNID—Any arthropod in the class *Arachnida*. Includes spiders, scorpions, mites, ticks, etc.

BAG LIMIT—The number allowed to be harvested in regulated hunting and fishing. A hunter may remove four pheasants each day. This is a bag limit.

BIG GAME—Large, hunted animals, such as antelope and deer. Examples of small game are rabbits, squirrels, pheasants, quail, etc.

BIOME—A complex of communities characterized by a distinctive type of vegetation and maintained under the climatic conditions of the region.

BIOTIC COMMUNITY—The living organisms in a community. Includes all plants and animals in the community. The non-living parts would be the abiotic parts of the community.

BLIND—A hiding place for observing or photographing.

BOOMING GROUND—An area in the prairie used by prairie chickens for their mating dance. The male birds make a booming sound while they dance to attract females.

BOTTOMLAND—Low-lying land, usually near a river.

BOUNTY—An old practice of paying for removing certain animals. This was thought to be useful in reducing pest animals but proved to be impractical.

BROWSE—This word can be a noun or verb. Brushy vegetation used by animals as food (noun). To eat the twigs and leaves of woody, brushy plants (verb). Deer, elk, and moose are browsers.

BRUSH PILE—Branches and other vegetation piled together for wildlife cover.

BURROW—A hole or tunnel in the ground made by a small animal for habitation and refuge.

CAMOUFLAGE—Color and/or pattern that blend into the environment.

CARNIVORE—Meat eater.

CARRION—Dead animals in the process of decaying. Crows feed on carrion.

CARRYING CAPACITY—The number of animals of a species that can be supported in a particular habitat at any given time. This number will change with the season, and from year to year. It depends on competition from other animals, rainfall, and other weather factors.

CHANNELIZATION—Changes made to a river bed to straighten, widen, or deepen it. Used in land reclamation, and mistakenly used in flood control attempts but is very harmful to the river habitat.

CLASSIFICATION—The assignment of plants and animals to groups within a system of categories distinguished by structure, origin, etc.

CLEARCUT—A logging practice that removes all the trees in an area.

COLD-BLOODED—Describes animals that change body temperature to match their surroundings.

COMMUNITY—A group of plants and animals living in a particular location and interacting with each other.

COMPETITION—Struggle among organisms for food, space, cover, and other requirements for existence.

CONSERVATION—The wise use of natural resources to assure their presence in the future.

CONSUMER—Uses plants or animals as food. Eats producers. A primary consumer, such as a rabbit, eats plants. A secondary consumer, such as a fox, eats primary consumers.

COVER—Shelter provided by vegetation, debris, and irregularities of the land. Used by wildlife for sleeping, hiding, feeding, and breeding areas.

COVEY—A small flock or group. Quail are often found in a covey.

CRITICAL HABITAT—Includes the areas of land, water, and air space occupied by an endangered species at the time this species is listed. This habitat is classified by the federal government as being necessary for the species' survival.

CRUSTACEAN—Any chiefly aquatic arthropod of the class *Crustacea*. Usually has a hard shell or crust covering the body. Includes lobsters, shrimps, crabs, barnacles, etc.

DABBLING DUCKS—Ducks that live near shallow marshes, ponds, and rivers. They tip their tails up to feed, with the majority of their bodies above water. These ducks take off in vertical flight when startled. Also called "puddle ducks."

DECOMPOSER—Plants and animals that feed on dead material and cause it to mechanically or chemically break down. Examples include bacteria, fungi, and earthworms.

DEN—A secluded place, as the lair of a predatory animal.

DINGELL-JOHNSON FEDERAL AID IN FISHERIES RESTORATION ACT—D-J funds provide federal cost shares for fisheries projects. Funds provided by an excise tax on some fishing equipment.

DIURNAL—Active during the day. Opposite of nocturnal.

DIVING DUCKS—Ducks that prefer deep water as in lakes and bays. They feed by diving below the surface and take flight from a running start.

DOMESTIC ANIMALS—Animals of the home or farm, such as dogs, cats, chickens, etc.

ECOLOGY—The scientific study of the relations of living things to one another. A scientist who studies these relationships is called an ecologist.

ECOSYSTEM—A system formed by the interaction of a community of organisms with each other and their nonliving environment.

EDGE EFFECT—The tendency of wildlife to concentrate at the edges of two adjacent vegetative or land use types. The combination of habitats provides extra food and shelter.

ENDANGERED—Species that are in danger of becoming extinct throughout all or a significant portion of their range.

ENVIRONMENT—The total of all surroundings including air, water, plant life, people, and wildlife. Physical and biological factors included.

ESTIVATE (Aestivate)—To spend the summer in a torpid, or dormant, condition.

EXOTIC—In conservation terminology, this refers to a foreign plant or animal that has been introduced into a new area. The ring-necked pheasant is an exotic introduced to the U. S. from Asia.

EXTINCT—Species that no longer exist. Examples include passenger pigeon, great auk, and the sea mink.

EXTIRPATED—Describes species that were removed in a particular area but are found elsewhere. Mountain plover were extirpated from Kansas and have only recently been reintroduced.

FENCEROW—Vegetation growing along a fence. Often used by wildlife for cover.

FISH AND GAME COMMISSION—Organization that has responsibility for the wildlife and habitat in the state. Each of the 50 states has a similar organization.

FLYWAY—Flight routes used by migratory birds. Kansas is in the Central Flyway.

FOOD CHAIN—The sequence by which energy is passed from sun to plants to animals. A green plant is eaten by an insect that is eaten by a bird, forming a simple food chain.

FOOD WEB—An interconnection of food chains.

FORAGE—Used as a verb and a noun. Refers to vegetation taken by herbivores (noun). Act of taking the vegetation (verb).

FORBS—For wildlife use, forbs are weeds and herbs, low-growing annual or perennial herbaceous plants.

GAME—Animals that can legally be hunted, fished, or trapped.

GENUS—Used in plant and animal classification as the subdivision of families or subfamilies. A genus usually has more than one species. The genus *Canis* includes dogs, wolves, coyotes, etc.

GRANIVORE—Grain eater.

HABITAT—The place in which an animal lives. It must include food, water, and cover. This involves escape cover, winter cover, cover to rear young, and space to play. Loss of habitat is the biggest single threat to wildlife.

HARE—Rodent-like mammals of the genus *Lepus* having long ears, a divided upper lip, and long hind limbs adapted for leaping. Distinguished from rabbits by having young that leave the nest in 24 to 48 hours. Hares are generally larger than rabbits. Jack rabbits are hares.

HERBIVORE—Plant eater.

HIBERNATE—Spending winter, or a portion of it, in a state of sleep; a torpid or resting state.

HUNT—To search for game animals for the purpose of catching or killing. Hunting is now regulated under comprehensive laws in every state. Sport hunting removes the surplus of wildlife as opposed to market hunting in pioneer days when nearly all edible or useful forms of wildlife were taken almost without restriction.

INTERACTION—The relationship of one organism to another. The action of one population affecting the growth or death rate of another population. One population may eat members of other populations, compete for food, etc. Interactions can be positive, negative, or neutral.

INTERDEPENDENCE—The interrelationships of wildlife with one another and with the various elements of their environment.

INTERSPERSION—Mixing of habitat types. Interspersion of habitat creates edge.

INVERTEBRATE—Animal without a backbone.

KINGDOM—A province of nature. The animal, vegetable, and mineral kingdoms.

LARVA—Immature, wingless, feeding stage of an insect that undergoes complete metamorphosis. Also, the young of any invertebrate.

LIFE CYCLE—The continuous sequence of changes undergone by organisms from one primary form to the development of the same form in a subsequent generation. Immature animals grow, reproduce, and leave more immature animals, defining the species' life cycle.

LIMITING FACTOR—Anything that controls the density of a population within its habitat. Factors include the quality and/or quantity of food, water, cover, predators, disease, and climate.

MAMMAL—Any vertebrate of the class *Mammalia* including humans. All members of this class have hair on their bodies and feed their young milk.

MARSH—A tract of low wetlands generally supporting cattails and other reeds, muskrats, mink, red-winged blackbirds, and a wide variety of other species.

MICROCLIMATE—The environmental conditions in a restricted area. A shady area of cottonwoods in the sunny prairie may create a microclimate.

MIGRATORY—Birds and other animals that make an annual trip to a different area. Distance may be long or short, depending on the species. Sandhill cranes migrate through Kansas on their way to Texas for the winter and Canada for the summer.

MIMICRY—The close external resemblance of an animal to another animal or its surrounding. Often serves as protection or concealment. Imitate; simulate.

MOLLUSK—Any invertebrate of the phylum *Mollusca* comprising the chitons, snails, bivalves, squids, octopuses, etc. Typically have a hard shell.

MOLT—To shed worn feathers or skin so they can be replaced, or to lose one seasonal coat so it can be replaced by another.

MONOCULTURE—Vegetation of a single species, generally even-aged. This situation allows for little wildlife diversity and is potentially dangerous because it is more susceptible to disease.

MORTALITY RATE—The relative frequency of death in a community.

MUTUALISM—A close association between two different species whereby each species gains some benefit.

NATALITY RATE—Rate of birth.

NATIVE SPECIES—An animal or plant indigenous to a particular region.

NATURAL SELECTION—Process resulting in the survival and perpetuation of only those forms of plant and animal life that are able to adapt to the environment.

NOCTURNAL—Active at night; opposite of diurnal.

NONGAME—Animals that are not hunted, fished, or trapped; this includes the threatened and endangered species, song birds, etc.

NONRENEWABLE RESOURCES—Resources, such as soil and minerals, which cannot be regenerated by themselves.

OMNIVORE—Animal that eats both plants and animals.

ORGANISM—A form of life composed of mutually dependent parts that maintain various vital processes; any form of plant or animal.

PARASITE—An animal or plant that lives on or in an organism of another species from whose body it obtains nourishment.

PESTICIDE—Chemical preparation used to control populations of organisms.

PHOTOSYNTHESIS—The process by which green plants convert carbon dioxide and water into simple sugar. Chlorophyll and sunlight are essential to the series of complex chemical reactions involved.

PHYLUM—The major subdivision of the animal kingdom, consisting of one or more related classes.

PITTMAN-ROBERTSON FEDERAL AID IN WILDLIFE RESTORATION ACT—Funds gathered from an excise tax on sporting arms and ammunition for wildlife management and research use. A cost-sharing program of the federal government with the states.

PLANKTON—Organisms (usually microscopic) suspended in aquatic habitat. Includes bacteria, algae, protozoans, rotifers, etc. Phytoplankton are the plant plankton; zooplankton are the animal species.

POLLUTION—Harmful substances deposited in the air, water, or land which lead to a state of impurity and, often, unhealthiness.

POPULATION—All the individuals of a particular species in a given area.

PREDATOR—An animal that hunts other animals for its food.

PRESCRIBED BURNING—Planned application of fire to a predetermined area. A technique used in wildlife management to gain regrowth of certain vegetation.

PREY—Animals that are hunted for food by other animals.

PRODUCER—Organisms eaten by consumers. Green plants are primary producers; they are able to make food from sunlight and organic substances.

PRONGHORN—The proper name for the American antelope, *Antilocapra americanus*. Not a true antelope; does not have true horns. Pronghorns belong to a family by themselves. They are not found outside of North America.

RANGE—(a) Home range: the geographic area in which an individual animal resides. (b) an area grazed by livestock and/or wildlife. (c) all lands including forest land that produce native forage, in contrast to land cultivated for agricultural crops or carrying a dense forest.

RAPTOR—Bird of prey, such as eagles, hawks, and owls. Predatory birds.

RECYCLING—The salvage and reprocessing of used materials, such as paper, glass, and aluminum.

REFORESTATION—The replanting of trees in forests that have been affected by cutting, fire, disease, etc.

REFUGE—A wildlife sanctuary. National wildlife refuges are located across the United States. Kirwin, Quivira, and Flint Hills NWR are in Kansas.

REINTRODUCTION OF SPECIES—A wildlife management technique in which a species is reintroduced into its historic range, replanted in areas where it was extirpated.

RENEWABLE RESOURCES—Resources, such as trees and wildlife, that renew themselves naturally.

REPTILE—Any cold-blooded, scaled vertebrate of the class *Reptilia*, including turtles, lizards, snakes, and crocodiles.

RESERVOIR—A place where water is collected and stored for use. Kansas has approximately 25 reservoirs, such as Cheney, Wilson, and Clinton.

RESIDENT WILDLIFE—Animals that are residents of a specific area on a year-round basis, as opposed to migratory.

RIPARIAN—Dwelling on the bank of a river or other body of water. Riparian habitat is situated along a river.

RIPRAP—A quantity of stone placed in water for fish cover, and to prevent bank erosion.

ROADSIDE DITCH—Areas bordering roads; can be excellent for wildlife habitat if they are left to grow and have diverse vegetation. Too often, these areas are mowed and their use to wildlife reduced or removed.

RODENT—A gnawing or nibbling mammal, including mice, squirrels, and rabbits. Animals in the order *Rodentia*.

SACS—The baglike structure in an animal or plant. The prairie chicken has orange sacs on the sides of its neck.

SCAVENGER—An animal that eats the dead remains and wastes of other animals and plants. Dermestid beetles are scavengers.

SEASON (OPEN SEASON)—In wildlife terminology, season refers to a time when hunting and fishing is permitted for a particular species. May be a few days or year-round.

SEDGE—A rush or grass-like plant growing in wet places; sawlike edge to blade of plant.

SHELTER—Cover; cover from elements for raising young, to travel in, for breeding, sleeping, etc. Varies by species.

SHELTERBELT—Rows of trees and shrubs generally on the north and west sides of farms, homes, or fields; protects from weather and provides wildlife habitat.

SKINK—Any of a family of small, smooth-scaled lizards.

SLOUGH—An inlet from a river; backwater; tide flat, a creek in a marsh.

SMALL GAME—A hunting term designating smaller hunted species, such as rabbits, squirrels, quail, etc. Compare with "big game."

SPECIES—A group of individuals that resemble one another and are able to breed among themselves but not able to breed with members of another species. A category of biological classification immediately below the genus or subgenus. Species is both singular and plural.

STEWARDSHIP—The concept of land responsibility—that we do not own land but are managers of the resource and responsible to future generations for the condition of the land when we leave it.

STRESS—Usually thought of as a physical factor that applies to detrimental pressure to an organism or population. A drought might stress an animal population possibly resulting in inhibited reproduction.

SUCCESSION—The orderly, gradual, and continuous replacement of one plant or animal by another. A bare field will gradually develop into a woodland if not disturbed by fire, mowing, etc.

SURPLUS—That quantity of wildlife above the carrying capacity. The surplus is removed by disease, starvation, hunting, or predation.

TALON—A claw from a bird of prey.

TERRITORY—An area defended by an animal against others of the same species. Used for breeding, feeding, or both. Wolves are territorial.

THREATENED—Species of plants and animals that are protected by law and are limited in number or range or both. May become endangered if reduction continues.

UNGULATE—A hoofed mammal.

UNITED STATES FISH AND WILDLIFE SERVICE—The federal organization responsible for wildlife on the national level. This organization sets standards and gives guidance to the state wildlife agencies.

UPLAND—The higher ground of a region; above the level where water flows. Upland game animals include prairie chicken, turkey, pheasant, quail, etc.

VERTEBRATES—Animals with backbones.

WARM-BLOODED—Animals that are able to maintain a fairly constant body temperature independent of their environments, as opposed to cold-blooded animals.

WATERFOWL—Water birds; usually ducks and geese but may be used in referring to shore birds and wading birds as well.

WILDFIRE—Any fire other than a controlled or prescribed burn occurring on wild land.

WILDERNESS AREA—An area established by the federal government to conserve its primeval character and influence for public enjoyment under primitive conditions in perpetuity.

WILDLIFE—All wild, living animals. Includes birds, fish, mammals, reptiles, amphibians, insects, mollusks, crustaceans, etc. Occasionally, the term is even applied to plants. Game and nongame animals are wildlife.

WILDLIFE MANAGEMENT—An effort based on the science of ecology and designed to maintain wildlife at certain population levels. This effort entails habitat manipulation and an understanding of wildlife population dynamics, diseases, behavior, and reproduction. This is done by wildlife managers working for the Fish and Game Commission and by other interested individuals and groups.

WILDLIFE RESEARCH—Investigating wildlife to gain information that can be used to better manage wildlife. Examples of projects might include taking a survey or census of populations, gathering and analyzing data about animal behavior, and studying and comparing the interaction of wildlife within habitats.

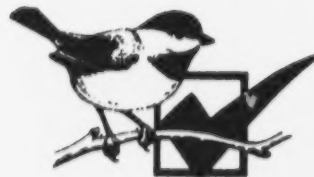

ZOOLOGY—The study of animals; a branch of biology.

Kansas is a great place to live and I'm here to tell you why.

It's a special place because Kansas has everything wildlife and people need to live.

We both need a lot of water. Kansas has rivers and lakes that give us water.

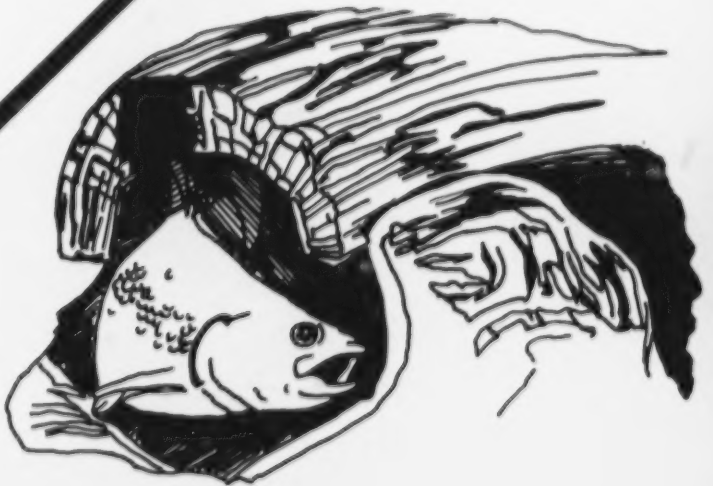

We need food. Food gives us energy to work and play.

Clean air is important for animals and people to breathe.
Could birds and kites fly without air?

And we need a place to live. Animal homes may look different than homes people live in but they are important for the same reasons.

Homes give us room to live and keep us safe.

They also keep us warm and out of the weather.

We both need space to work and play in. Space is important so we are not too crowded.

KANSAS

Kansas is special to you and me. We can keep it that way if there's always water, food, clean air, space, and places to live.

wildlife means friend

Wildlife means all the wild living creatures
that walk on land, swim in streams, and fly in the air.
We share the earth with wildlife.

You can see wildlife if you
look in your yard, in a tree, or by a stream.
Wildlife is all around you.

Wildlife needs you to leave it wild and free,
to save the things it needs to live—
water, food, air, space, and a place to live.

Wildlife is a special part of Kansas.
You are a special part of Kansas.
Let's live together as friends.
